Explosive, any substance or device that can be made to produce a volume of rapidly expanding gas in an extremely brief period. There are three fundamental types: mechanical, nuclear, and chemical. A mechanical explosive is one that depends on a physical reaction, such as overloading a container with compressed air. Such a device has some application in mining, where the release of gas from

Student Exploration- Balancing Chemical Equations (ANSWER KEY)

2. What is called chemical change? Ans: A chemical transition, also known as a chemical reaction, is a process that transforms one or more substances into one or more new and different substances. A chemical transformation, in other words, is a chemical reaction involving the rearrangement of atoms. 3. What is the evidence of a chemical change?

One answer is that while gas attacks are terrifying, the weapon has proved to be militarily ineffective. After Ypres, the allies provided masks to their front-line troops, who stood in their trenches killing onrushing Germans as clouds of gas enveloped their legs. That was true even as both sides climbed the escalatory ladder, introducing increasingly lethal chemicals (phosgene and mustard gas

I was the key to a pioneering chemical discovery. What molecule am I? Urea, also known as carbamide, is a safe, useful compound with a significant history. It is a naturally occurring molecule that is produced by protein metabolism and found abundantly in mammalian urine. In 1828, the German chemist Friedrich Wöhler¹, then at the Polytechnic School (now Technical University) of Berlin

Recognize chemical reactions as single-replacement reactions and double-replacement reactions. Use the periodic table, an activity series, or solubility rules to predict whether single-replacement reactions or double-replacement reactions will occur. Up to now, we have presented chemical reactions as a topic, but we have not discussed how the products of a chemical reaction can be predicted

Chemical Quantities Answer Key

Key Concepts: Terms in this set (50) Stoichiometry is the numerical relationships among chemical quantities in a balanced chemical equation. Stoichiometry allows us to predict the amounts of products that form in a chemical reaction based on the amount of reactants. Given: 3 mol N₂ Find: mol NH₃ 3H₂ (g) + N₂(g) → 2NH₃ (g) 3 moles H₂ = 2 moles NH₃ 1 mol N₂ = 2 mole NH₃ 3 mols N₂ X 2 mol

Isopentane | C₅H₁₂ - PubChem

Male mice of ICR strain were exposed to about 5% n-pentane for one hour while the oxygen in the environmental air was maintained at about 20%. Then their blood and liver tissue were collected and analyzed by means of GC and GC-MS. The metabolites thus obtained were 2-pentanol, 3-pentanol and 2-pentanone. The same procedure was repeated with isopentane; 3-methyl-2-butanol, 2-methyl-2-butanol and

Answer. N₂ + 3H₂ → 2NH₃. Many chemical equations also include phase labels for the substances: (s) for solid, (l) for

liquid, (g) for gas, and (aq) for aqueous (i.e., dissolved in water). Special conditions, such as temperature, may also be listed above the arrow. For example, $2\text{NaHCO}_3(\text{s}) \rightarrow 200\text{ }^\circ\text{C Na}_2\text{CO}_3(\text{s}) + \text{CO}_2(\text{g}) + \text{H}_2\text{O}(\text{l})$ Key Takeaways. This is a HUGE question to answer completely! One answer is 'because they result in a negative change in free energy, delta-G.' This may be as a result of the reaction being exothermic, so the products are more stable than the reactants, or could be a result of an increase in entropy (products more disordered than the reactants), or both of these.
