The open system of the clam is not complete; blood pools around the heart, as a result there is less pressure. The blood of the closed system like humans is confined within the blood vessels and heart, resulting in a high pressured system. The high pressure system allows for a higher level of activity. 12.

Describe the movement of the food through the current siphon through the digestive system of the clam. It takes in water through the incurrent siphon. Move over gills. food then moves into the mouth. then through the esophagus into the stomach. then through the intestine and exits the anus. out through the excurrent siphon.

### **Dissection 101: Clam - SDPB**

Clam Dissection Guideline BACKGROUND: Clams are bivalves, meaning that they have shells consisting of two halves, or valves. The valves are joined at the top, and the adductor muscles on each side hold the shell closed. If the adductor muscles are relaxed, the shell is pulled open by ligaments located on each side of the umbo.

### **Wood vol2 MarinSci pp235 280 - BIOLOGY JUNCTION**

Clam Dissection. Introduction. The phylum Mollusca includes snails, clams, chitons, slugs, limpets, octopi, and squid. As mollusks develop from a fertilized egg to an adult, most pass through a larval stage called the trocophore. The trocophore is a ciliated, free-swimming stage. Mollusks also have a radula or file-like organ for feeding, a mantle that may secrete a

shell, and a muscular foot for locomotion.

### **Clam Dissection Lab Questions Answer Key**

Clams are bivalves that spend most of their time lying on the seafloor. When frightened, a clam uses its wedge-shaped, muscular foot to burrow into the sediment. The clam foot can also help a clam move across the sediments. The soft tissue located just above the foot, the visceral mass, contains a clam's organs.
