Math Questions With Answers (6): Slope and Lines

The slope of two given points is the ratio of the change in y over the change in x: 2 - -8 / -4 - -4 = 10 / 0 = 0, so the slope is undefined. Notice the x term is the same in both coordinates. The line is vertical, therefore has an undefined slope.

Find the slope of the line passing through the given ...

When you are given a slope-intercept form equation, then finding the slope is simple: since the slope-intercept form is y = mx + b, and m = slope, it would simply be the coefficient of x. For example, if the question were, "Find the slope when the equation is y = 5x + 2", the slope would be 5, because that is where the slope goes in a slope-intercept form.

How to find slope from an equation? The method for finding the slope from an equation will vary depending on the form of the equation in front of you. If the form of the equation is y=mx+c, then the slope (or gradient) is just m.If the equation is not in this form, try to rearrange the equation. To find the gradient of other polynomials, you will need to differentiate the function with respect ...
