In cases where there are more predictors within a class than samples, the `classDist` function has arguments called `pca` and `keep` arguments that allow for principal components analysis within each class to be used to avoid issues with singular covariance matrices. `predict.classDist` is then used to generate the class distances.

PLS decreases the independent variables down to a smaller number of uncorrelated components, similar to Principal Components Analysis. Then, the procedure performs linear regression on these components rather the original data. PLS emphasizes developing predictive models and is not used for screening variables. Unlike OLS, you can include multiple continuous dependent variables. PLS uses the

The plot at the very beginning of the article is a great example of how one would plot multi-dimensional data by using PCA, we actually capture 63.3% (Dim1 44.3% + Dim2 19%) of variance in the entire dataset by just using those two principal components, pretty good when taking into consideration that the original data consisted of 30 features which would be impossible to plot in any meaningful

As EEMD is a time-space analysis method, the added white noise is averaged out with sufficient number of trials; the only persistent part that survives the averaging process is the component of the signal (original data), which is then treated as the true and more physical meaningful answer. The effect of the added white noise is to provide a

Linear Discriminant Analysis For Dummies. It works on a simple step-by-step basis. Here is an example. These are the three key steps. (i) Calculate the separability between different classes. This is also known as between-class variance and is defined as the distance between the mean of different classes. Between Class Variance (ii) Calculate the within-class variance. This is the distance

The principal components are supplied with normalized version of original predictors. This is because, the original predictors may have different scales. For example: Imagine a data set with variables' measuring units as gallons, kilometers, light years etc. It is definite that the scale of variances in these variables will be
