A certain network consists of large number of ideal linear resistances, one of which is designated as R and two constant ideal sources. The power consumed by R is P_1 when only first source is active and P_2 when only the second source is active. If both sources are active simultaneously then the power consumed by R is: $P_1 \pm P_2$

Network analysis is the process of finding the voltages across, and the currents through, every component in the network. There are many different techniques for calculating these values. However, for the most part, the applied technique assumes that the components of the network are all linear.

Van Valkenburg Network Analysis Solution

A useful procedure in network analysis is to simplify the network by reducing the number of components. This can be done by replacing physical components with other notional components that have the same effect. A particular technique might directly reduce the number of components, for instance by combining impedances in series.
