To distinguish this development computer (usually a PC or Unix workstation) from the target embedded system, it is referred to as the host computer. The compiler, assembler, linker, and locator run on a host computer rather than on the embedded system itself. Yet, these tools combine their efforts to produce an executable binary image that will execute properly only on the target embedded

While these tools supply interfaces to different programming languages, the fundamental concepts of programming are preserved in each case: a script written for PyMOL can be transliterated to a VMD script, and a closure in a Coot script is roughly equivalent to a closure in a Python script (see Supplemental Chapter 13 in S1 Text). Because the logic underlying computer programming is universal
